SEARCH REQUEST FORM

Access DB# 15289

Scientific and Technical Information Center

Requester's Full Name Scott BELUEA Examiner #: 79346 Date: 5/9/05
Art Unit: 2614 Phone Number _____ Serial Number: 09/841,007
Location: _____ Results Format Preferred (circle): PAPER DISK E-MAIL
KNX 6A01

If more than one search is submitted, please prioritize searches in order of need.

Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elect species or structures, keywords, synonyms, acronyms, and registry numbers; and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: TV having Language selection function and control method of the same
Inventors (please provide full names): TAE KYUNG Lee

Earliest Priority Filing Date: 4/27/2000

For Sequence Searches Only Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.

Internet TV / PCTV Looking for TV that determines if Received character information (ex closed captioning, chat, text, etc.) is in the user selected language (english) and if it isn't it sends the text to an internet translation site for translation (ex french-english) and then displays the results

TV menu → English → French → determines wrong language → goes to internet site for language translation

... language programming, whether received off-air or delivered by
cable or satellite or video.

The **TeleTranslator** operates at a high rate of accuracy and has a
number of specialized features that enhance its usability, both as a
translator and as a **language** education tool. The units will retail for
U.S. \$349.95.

The **TeleTranslator** works by decoding the English-text
closed-captioning signal embedded in most current programming, both
pre-recorded and live, and instantly **translating** the decoded **text** into
Spanish for presentation on-screen as Spanish subtitles.

"The potential for the **TeleTranslator** in the U.S., where Hispanic
households number approximately 7.6 million, is significant," says...

Title: Machine translation of closed captions
...Abstract: systems are designed to translate documents. In this paper we describe an MT system that **translates** the **closed captions** that accompany most North American **television** broadcasts. This domain has two identifying characteristics. First, the captions themselves have properties quite different...

... the operational characteristics of the closed-caption domain are also quite distinctive. Unlike most other **translation** domains, the **translated captions** are only one of several sources of information that are available to the user. In addition, the user has limited time to comprehend the **translation** since **captions** only appear on the screen for a few seconds. In this paper, we look at...

... Bake MT paradigm, which relies heavily on lexical resources. The system currently provides wide-coverage **translation** from **English** to **Spanish**. In addition to discussing the design of the system, we also address the evaluation issues...

Title: Recognition of bi-lingual texts

Abstract: The paper describes the problem of recognition of bi-lingual **texts**, written with two different alphabets. Russian PC users often face this problem when they are recognizing technical or economical **texts**, full of terms written in English. The main ideas of the paper are implemented in

... BIT Software, Inc.". As alike letters in different alphabets have different codes, to input the **text** into the computer we need to define the alphabet (i.e. the language) of each word. The processing of bi-lingual **text** can be divided into two stages: the recognition of concrete symbols and the choice of...

... are called graphemes. We have to choose the language when we want to form the **text** out of recognized symbols. There are three main sources of information used to **detect** the **language**: recognition results; lexical information; contextual and stylistic analysis.

Degree: PH.D.

Year: 1995

Corporate Source/Institution: UNIVERSITY OF CALIFORNIA, LOS ANGELES (0031)

Source: VOLUME 56/09-A OF DISSERTATION ABSTRACTS INTERNATIONAL.

PAGE 3708. 640 PAGES

How do sixteenth to nineteenth century Maya **texts** interpret sexuality, gender, and the human body? This work seeks to answer that question by analyzing a large number of Maya **language** documents, which I **translate** here. I place these **texts** in the ethnohistorical context of colonial Yucatan. I compare the conclusions that I draw from them with many of the statements in both Spanish and Nahuatl **language** documents, thus **determining** similarities and differences between the various groups. I am able to draw conclusions authoritatively only because I use many different genres of Maya documentation.

This work shows that the Maya **texts** did not view the human body itself as a unified entity. The body is often...

Brazil considers linguistic barricade
Downie, Andrew
Christian Science Monitor, p 7
Sep 6, 2000

NEWSPAPER CODE: CSM

; Newspaper article

LANGUAGE: English

RECORD TYPE: ABSTRACT

...ABSTRACT: a law to enforce language purity by banning foreign words from everyday transactions unless Polish **translations** are provided alongside. A Polish **language** council will catch violators, who could face stiff fines. Poland's campaign has been compared...

...and social situations. While those strictures are laughed off by many as unenforceable - one envisions " **language** police" **monitoring** cafe **chatter** and the like - Rebelo's bill thunders that those not respecting Portuguese are "damaging Brazil..."

...SPECIFICATION With this arrangement, if the caption is broadcast only in Japanese by character broadcasting, the **caption** in Japanese can be **translated** into **English** and the **caption** in English can be displayed simultaneously with the caption in Japanese.

While the embodiment of FIGS. 12 and 13 is described in terms of **translating** the **caption** in Japanese into **English** and displaying the caption in English, it may be appreciated that the **caption** may be **translated** into one or more than one desired **languages** when corresponding **translation** means are provided.

While the present invention is described above by way of two preferred embodiments adapted to display a caption transmitted by way of digital **television** broadcasting, the present invention is by no means limited thereto and can be used to...

...ABSTRACT in permanent memory (24). Equivalent data is transmitted in the vertical blanking interval (VBI) to **television** receivers (17). Each equivalent data set comprises a unique **language identifier** (38) and a foreign **language translation** (36) of, or graphical representative of, the local language pre-stored in permanent memory. The...

...SPECIFICATION translations of a command set, called equivalent data, to be displayed on the screen of **television** receivers instead of a local language version of the command set. The command set can...

...prompts to guide the viewer in programming a VCR or performing other VCR and/or **television** related tasks such as initial setup or sound or picture adjustment. The transmitted equivalent data includes a plurality of foreign **language translations** of, or graphical data representations of, the local **language** and a plurality of **language identifiers**, each being unique to one of the foreign **language translations** or graphical data representations. The invention is described below in conjunction with a cable **television** service, but it can also be used in a satellite or broadcast **television** service.

A host program source and a source of equivalent data at the headend of a **television** transmission system are coupled to a vertical blanking interval (VBI) encoder to insert the equivalent...

...CLAIMS choosing one of the transmitted foreign languages from the language menu; and substituting the foreign **language translation** corresponding to the chosen foreign **language** for the displayed local language command.
2. The method of claim 2, additionally comprising the steps of: attaching to the transmitted equivalent data a plurality of **language identifiers** (38a, 38b,..., 38n), each being unique to one of the foreign **language translations** or graphical data representations; inputting a choice among the **language identifiers**; comparing the inputted choice with the **language identifiers** attached to the equivalent data; and storing the equivalent data when a match occurs in...

...comparing step.

3. The method of claim 2, additionally comprising the step of transmitting a **television** signal from a head end to the television receiver, the step of transmitting equivalent data...

...of the transmitted foreign languages from the language menu; and means for substituting the foreign **language translation** corresponding to the chosen foreign **language** for the displayed local language command.

10. The apparatus of claim 9, additionally comprising: means for attaching to the transmitted equivalent data a plurality of **language identifiers** (38a, 38b,..., 38n), each being unique to one of the foreign **language translations** or graphical data representations; means for inputting a choice among the **language identifiers**; means for comparing the inputted choice with the **language identifiers** attached to the equivalent data; and means for storing the equivalent data when a match...

Claims

English Abstract

...in permanent memory (24). Equivalent data is transmitted in the
vertical blanking interval (VBI) to **television** receivers (17). Each
equivalent data set comprises a unique **language identifier** (38) and a
foreign **language translation** (36) of, or graphical representative of,
the local language pre-stored in permanent memory. The...

Claim

... ROM,

5 11, A method for displaying textual or graphic data on the screen of
television
receivers comprising the steps of,
displaying local language commands on the screen of each **television**
receiver; transmitting to one or more of the **television** receivers
equivalent data, the equivalent data including a plurality of foreign
language translations, or graphical
representative, of the local language commands;
choosing one of the transmitted foreign **language translations** at one
of the
television receivers; and
substituting the chosen foreign **language translation** for the
displayed local **language** command.

12 The method of claim 11, additionally comprising the steps of
attaching to the transmitted equivalent data a plurality of **language**
identifiers . each being unique to one of the foreign **language**
translations or graphical data
representations;
inputting a choice from among the **language identifiers** ;
comparing the inputted choice with the **language identifiers** atwhed to
the
equivalent data; and
storing the equivalent data when a match occurs in...

Teletext reproduction circuit for TV receiver...

...has language translation circuit in receiver for text signals prior to display

...Abstract (Basic): The circuit displays text signals in different languages on the image screen of a **TV** receiver, the text signals being transmitted together with the **TV** signal. In the receiver the **text** signals are **translated** by an appropriate circuit (22) in a different **language** and then displayed. Preferably the **translated text** signals are displayed in addition to the transmitted text signal
...

...The original and **translated** text signals may be displayed in the left- or right-hand image half next to each...

...translated and then directly displayed. It is of advantage to record the original and the **translated text** signals on a carrier, which enables processing of the text signals independently of the image...

TV programmes audio accompaniment unit...

...Abstract (Basic): to transmitter (2) and the set passes to transmitting
antenna (5). The receiver can receive TV programmes with several
translation languages or receive with stereo sound accompaniment.
For the former the signal containing several audio subcarriers...

...used for the right. A tuner-decoder made by G1 (TOCOM) can be used to
detect the language required...

...USE - Unit concerns TV and is for transmitting stereo sound and
synchronous translation into several languages .

ABSTRACT

PROBLEM TO BE SOLVED: To automatically **identify** the **language** of a **text** to be converted or **translated** in a system for converting a text message to voices, and to appropriately perform **text** /speech conversion or **text** /**text translation** .

SOLUTION: An integrated message system 100 is provided with an audio gateway **server** 140 connected to an electronic mail system and a private branch exchange 120. The audio gateway **server** 140 provides an audio message service for the group of subscribers. Inside the audio gateway **server** 140, a triple sound character analyzer investigates continuous three characters in a text message, determines...

... a text example written in the specified language with the occurrence frequency and generates the **language identifier** and approximate degree of the text message. Based on the **language identifier** , a message inquiry unit selects a suitable text speech engine and converts the text message to **computer** - created speech to be spoken for the subscribers.

Text from one language to another translating system, has server
and client with dictionary database for associating words in one language
with words in another...

Abstract (Basic):

... A server (810) and client computer (800) has respective
dictionary database (830) which stores associating words in two
languages . A translating software which translates user selected
words from one language to another determines whether the selected
word is in the client database and if not, queries the server
database for the selected word's translated word.

... For translating words from one language into another
language and for teaching vocabulary words in multiple languages to
students...

...Words from one language to another language translating system is
achieved by storing dictionary database with associating words in two
language in server and client computers and the database is used by
translating software for translation...

...The figure shows the schematic diagram of network based computer
system for translating words from one language to another...

ABSTRACT

... essentially the same content information is increased in a method for dealing with each national language service problem by translating the copies of respective Web pages into respective target languages .
SOLUTION: Dynamic language translation is provided for a content portion through the use of a dynamic translation service which stores language information associated with specific client and user information. The dynamic translation service determines a language based on the client and user information. A skeleton of the content portion is then determined containing content elements of the content portion. The skeleton content elements are translated into the determined language based on the client and user information using stored translation tables of each skeleton content element or using dynamic natural language translation of each skeleton content element. The translated skeleton content elements are then merged into the...

... method for computer network, involves searching database using sending
and receiving party information to determine language pair, and
translating message from one language to another of pair

Abstract (Basic):

... informati on. An SMS message translation database is searched
using one of the information to **determine** a **language** pair. The
message is **translated** from one **language** to another **language** of
the language pair. A portion of the message is communicated to a user
of...

... for translating electronic mail, instant message, chat, SMS
messages, electronic text, word processing file, Internet **web** **page** ,
Internet search result and other textual communication over a computer
network e.g. modem or...

...provides automatic translation of user defined communication in a
computer network. The method provides improved **language** **translation**
services to Internet users and remote device users while not requiring
substantial modification to the...

(54) DYNAMIC IMAGE DISPLAY SYSTEM AND DYNAMIC IMAGE DATA RECORDING METHOD

(57)Abstract:

PROBLEM TO BE SOLVED: To provide a dynamic image display system by which sub-video-image display in large number of languages is supported with a small data amount.

SOLUTION: Sub-video-image data such as superimposed character in dynamic image data that is read by a DVD drive 16 and recorded on a DVD are recorded by text data in any language, a dynamic image display control program 31 to generate the sub video image from the text data makes a request of translation of a language designated by the user of the text data to a translation application program 32 when the language of the text data differs from the language designated by the user. The dynamic image display control program 31 that obtains the text data in the language designated by the user generates the sub video image from the text data and transfers the generated sub video image to a DVD decoder board 17, where the sub video image is composed with a main video image.

CLAIMS

[Claim(s)]

[Claim 1] In the dynamic-image display system which reads and carries out the cine mode display of said video data from the record medium with which digital compression coding is carried out and the video data which comes to contain the main image data and subimage data is recorded The video decoder which the text data for displaying a character string is recorded on said record medium as said subimage data, and decodes said main image data, A subimage creation means to create a subimage from the transmitted text data, A synthetic means to compound the video data which said video decoder decoded, and the subimage which said subimage creation means created, When the same as a translation means to translate into the 2nd language which had the text data of the 1st transmitted language specified, and the language, with which the display demand of the language of the text data recorded as said subimage data was carried out When transmit said text data to said subimage creation means, a subimage is made to create and it differs The dynamic-image display system characterized by coming to provide a display-control means to make the language by which the display demand was carried out translate said text data into said translation means, to transmit the text data after the translation to said subimage creation means, and to make a subimage create.

[Claim 2] The text data for displaying a character string is multiplexed by said record medium in two or more language including the language defined beforehand, and is recorded on it as said subimage data. Said display-control means When the text data of the language by which the display demand was carried out exists in the text data of two or more language recorded as said subimage data When transmit the text data to said subimage creation means, a subimage is made to create and it does not exist The dynamic-image display system according to claim 1 characterized by coming to provide a means to make the language by which the display demand was carried out translate into said translation means the text data of said language defined beforehand, to transmit the text data after the translation to said subimage creation means, and to make a subimage create.

[Claim 3] In the dynamic-image display system which reads and carries out the cine mode display of said video data from the record medium with which digital compression coding is carried out and the video data which comes to contain the main image data and subimage data is recorded The video decoder which the text data for displaying a character string is recorded on said record medium as said subimage data, and decodes said main image data, The display controller which compounds the video data decoded by said video decoder on the image drawn by video memory, and indicates by the display, A subimage drawing means to create a subimage from the transmitted text data, and to draw to said video memory, When the same as a translation means to translate into the 2nd language which had the text data of the 1st transmitted language specified, and the language, with which the display demand of the language of the text data recorded as said subimage data was carried out When transmit said text data to said subimage drawing means, said video memory is made to draw a subimage and it differs The dynamic-image display system characterized by coming to provide a display-control means to make the language by which the display demand was carried out translate said text data into said translation means, to transmit the text data after the translation to said subimage drawing means, and to make a subimage draw.

[Claim 4] The text data for displaying a character string is multiplexed by said record medium in two or more language including the language defined beforehand, and is recorded on it as said subimage data. Said display-control means When the text data of the language by which the display demand was carried out exists in the text data of two or more language recorded as said subimage data When transmit the text data to said subimage drawing means, a subimage is made to draw and it does not exist The dynamic-image display system according to claim 3 characterized by coming to provide a means to make the language by which the display demand was carried out translate into said translation means the text data of said language defined beforehand, to transmit the text data after the translation to said subimage drawing means, and to make a subimage draw.

[Claim 5] Said translation means is a dynamic-image display system according to claim 1, 2, 3, or 4 characterized by

being the application program in which execution control is carried out by CPU.

[Claim 6] Said display-control means makes a subimage the text data recorded as subimage data, or the text data after a translation, and is a dynamic-image display system according to claim 1, 2, 3, 4, or 5 characterized by coming to provide a means to output to the device specified without the ability being shown a dynamic-image table.

[Claim 7] It is the dynamic-image method of presentation which reads and carries out the cine mode display of said video data from the record medium with which digital compression coding is carried out and the video data which comes to contain the subimage data which consist of text data for displaying the main image data and a character string is recorded. When the same as the step which decodes said main image data, and the language with which the display demand of the language of the text data recorded as said subimage data was carried out The step which creates a subimage from said text data, translates said text data into the language by which the display demand was carried out, and creates a subimage from the text data after the translation when it differs, The dynamic-image method of presentation characterized by coming to provide the step which compounds said decoded video data and said created subimage.

[Claim 8] The animation data-logging approach which is the animation data-logging approach which carries out digital compression coding of the video data which comes to contain the main image data and subimage data, and is recorded on a record medium, and is characterized by what is recorded on said record medium by using the text data for displaying a character string as said subimage data.

[Claim 9] The animation data-logging approach which is the animation data-logging approach which carries out digital compression coding of the video data which comes to contain the main image data and subimage data, and is recorded on a record medium, and is characterized by what the text data for displaying a character string is multiplexed in two or more language, and is recorded on said record medium as said subimage data.

DETAILED DESCRIPTION

[Detailed Description of the Invention]

[0001]

[Field of the Invention] This invention relates to the dynamic-image display system which compounds subimages, such as a title, with the main image, and carries out a cine mode display, and relates to the dynamic-image display system which can support the subgraphic display in much language by the small amount of data especially.

[0002]

[Description of the Prior Art] The so-called multimedia-ization whose data dealt with also contain text data or not only graphics data but voice data, a video data, etc. has been attained with development of computer technology in recent years. And DVD (Digital Video Disc) etc. exists as a medium which records such multimedia-ized data.

[0003] When 32 kinds of subimage data can be given, for example, it records digital video datas, such as a movie, the title data for 32 languages can be made to add at the maximum by DVD-VIDEO specification which specifies a record format of this DVD.

[0004]

[Problem(s) to be Solved by the Invention] However, in order to record the all by the image data and to support the title display of 32 languages, the title data added, for example as a title of a movie had to create these 32 kinds of image datas, and had to record them on DVD.

[0005] Therefore, if it is going to respond to many needs, the amount of data of the title data which the work cost is made to increase and are made to record on a record medium, i.e., subimage data, will also make it have been to increase.

[0006] This invention is made in view of such a situation, and it aims at offering the dynamic-image display system which can support the subgraphic display in much language by the small amount of data.

[0007]

[Means for Solving the Problem] In order to attain the purpose mentioned above, it is made to make this invention record on a storage by making subimage data, such as a title, into text data as an image data. And a subimage is created from this text data, and it compounds with the main image, and is made to carry out a cine mode display. Moreover, when the language for which a user asks differs from the language of the text data recorded as subimage data, it translates into the language with which a user asks for the text data, and a subimage is created from the text data after the translation.

[0008] Therefore, in this invention, the subgraphic display by which language can also be supported now by one text data. the work cost can be boiled sharply, and it can reduce, and the limited resource in a record medium is consumed vainly -- ** (the subimage data of other language other than the language which he uses for a user are useless) -- it becomes possible to prevent what was said.

[0009] The text data made to record as this subimage data By recording the text data created in two or more language (here, Japanese shall be adopted as language other than English) including the language (here, it considers as English) which the number of does not necessarily need to be one, for example, was defined beforehand It makes it possible to display a subimage without a translation about the language (it to be supposed for that there are many users of English and Japanese here) considered for there to be many users. Also about the subgraphic display in other language By translating from the language (English) defined beforehand, it does not place out of a support.

[0010] Moreover, by recording subimage data as text data, this text data will be compounded with the main image as a subimage, and will not carry out a cine mode display, but it can also be made easy to display on the cheap display in which a text display is possible separately. It can provide as it is, without spoiling a part of main image by the title to the user who follows, for example, does not need a title, a title can be offered through the display to the user who is one

side and needs a title, and it becomes possible to respond to coincidence at the needs of both users.

[0011] Furthermore, it has disk drive equipment which drives record media, such as DVD, and it is also possible to utilize the translation software which is a user's property in the computer system corresponding to multimedia in which a cine mode display, voice playback, etc. are possible.

[0012]

[Embodiment of the Invention] Hereafter, 1 operation gestalt of this invention is explained with reference to a drawing. The system configuration of the personal computer concerning this operation gestalt is shown in drawing 1. This personal computer is equipped with PCI bus 1, CPU11, the host/PCI bridge 12, main memory 13, HDD14, the keyboard controller (KBC) 15, the DVD drive 16, the DVD decoder board 17, the display controller 18, video memory (VRAM) 19, CRT20, etc. as shown in drawing 1.

[0013] CPU11 controls actuation of this whole system, and performs an application program including the operating system and utility which were stored in main memory 13. And the dynamic-image display control of the video data read by the DVD drive 16 is performed by the dynamic-image display-control program 31 performed by this CPU11.

[0014] The DVD drive 16 drives DVD which carried out digital compression coding and recorded the video data with a subimage, and functions as drive equipment for reading the video data recorded on the DVD. And since the record approach of the subimage data to DVD driven by this DVD drive 16 is just going to set to one of the descriptions of this invention, with reference to drawing 2, that record format is explained first.

[0015] Video datas, such as a movie, consist of the management information section and data division, and data division contain many data blocks as shown in drawing 2. The linguistic code of text data used as a subimage mentioned later is stored in this management information section by that class. Moreover, the Navi pack is arranged at the head of each data block, from this Navi pack to the following Navi pack becomes one data block, and the record location of each of each Navi pack is also stored in the management information section.

[0016] On the other hand, the Video pack, the S.P pack, and the Audio pack are multiplexed and recorded on each data block. And in a Video pack, voice data is stored in subimage data and an Audio pack at the main image data and an S.P pack, respectively. And the storing approach of the subimage data to the S.P pack of these is just going to consider as the description of this invention. This S.P pack consists of a header and an S.P packet, and the title data of at least one or more languages are intermingled in this S.P packet, and it is stored in it. And this title data consists of control information and text data, and the linguistic code of this text data, a time stump, playback time amount, etc. are stored in control information. That is, in this invention, it is characterized by the point which does not record subimage data, such as a title, on a record medium by the image data, but is recorded on a record medium by text data.

[0017] After the video data recorded on DVD in such a format is read by the DVD drive 16, by the dynamic-image display-control program 31 in which execution control is carried out by CPU11, it separates into a Video pack, an S.P pack, and an Audio pack, and the Video pack and Audio pack of these are transmitted to the DVD decoder board 17.

[0018] With the DVD decoder board 17 which received this transfer by the PCI bus interface section 171, a Video pack is handed over by the MPEG 2 decoder section 174 under the synchronours control of the system decoder section 172, an Audio pack is handed over by the voice decoder section 173, respectively, and decoding is given. On the other hand, an S.P pack will be used for creation of a subimage by the dynamic-image display-control program 31 as it is. Creation of this subimage is first started from choice of the text data stored in an S.P pack. When the linguistic code which shows the language with which a user wishes this choice is stored in the management information section, only the text data by which that linguistic code was stored in control information is taken up, and all the other text data are canceled. When the linguistic code which shows the language which a user wishes on the other hand is not stored in the management information section, only the text data by which the linguistic code defined beforehand was stored in control information is taken up, and all the other text data are canceled.

[0019] The case where the linguistic code which shows the language which a user wishes here is stored in the management-information section means that the text data created in the language which a user wishes exists, and the case where the linguistic code which shows the language which a user wishes on the other hand is not stored in the management-information section means that the text data created in the language which a user wishes does not exist. Then, it requests changing the dynamic-image display-control program 31 into the text data of the language with which he hands over to the translation application program 32 with the linguistic code which shows the language with which a user wishes the taken-up text data (language defined beforehand), and a user wishes the text data, when the linguistic code which shows the language which a user wishes is not stored in the management information section. This translation application program 32 may apply the translation software which is the application program which is stored in main memory 13 and performed by CPU11, for example, is a user's property. Therefore, the dynamic-image display-control program 31 will not be concerned with whether DVD is recording the text data of which language as subimage

data, but the text data of the language which a user wishes can be obtained.

[0020] Next, the dynamic-image display-control program 31 creates a subimage from the text data of the language which the user who did in this way and got wishes, and transmits this created subimage to the DVD decoder board 17. The synchronization with the main image is taken and this subimage is handed over by the system decoder section 172 at the synthetic section 175. And in the synthetic section 175, composition with the main image created by decoding of the MPEG 2 decoder section 174 and the subimage created by the dynamic-image display-control program 31 is performed, and one dynamic image is created. And the dynamic image which the dynamic image with which this main image and a subimage were compounded was supplied to the digital video interface section 176 and the NTSC encoder 177 from the synthetic section 175, and was supplied to the digital video interface section 176 is displayed on CRT20 by being further transmitted to the display controller 18 and being written in video memory (VRAM) 19. On the other hand, the dynamic image supplied to the NTSC encoder 177 is enabling the display on a television screen, when encoded by the NTSC signal.

[0021] namely, in the personal computer of this operation gestalt As shown in drawing 3, the video data recorded on DVD read by the DVD drive 16 After being transmitted to the dynamic-image display-control program 31 performed by CPU11 (drawing 3 (1)), The main image data are transmitted and decoded by the DVD decoder board 17 (drawing 3 (2)), and a subimage will be created by dynamic-image display-control program 31 self after subimage data are handed over by the translation application program 32 if needed (drawing 3 (3)).

[0022] And it enables a display on a television screen by performing the output of an NTSC signal while it is displayed on CRT20 by being transmitted to the display controller 18 and written in video memory (VRAM) 19 (drawing 3 (5)), after the subimage created by this dynamic-image display-control program 31 is transmitted to the DVD decoder board 17 (drawing 3 (4)) (drawing 3 (5)). In addition, also when it replaces with a transfer of the subimage from the dynamic-image display-control program 31 to the DVD decoder board 17 and dynamic-image display-control program 31 itself draws a subimage to video memory (VRAM) 19 (drawing 3 (4)), it is possible to display on CRT20 the dynamic image with which the main image and the subimage were compounded (subgraphic display in a television screen is not performed in this case).

[0023] Here, with reference to drawing 4 and drawing 5, the operations sequence of the personal computer system of this operation gestalt is explained. In the personal computer system of this operation gestalt, after the assignment input of the language of a subimage is performed by the user (step A1 of drawing 4) and the assignment input of the language of this subimage is first performed at the time of playback of a dynamic image, the input of a video data is started (step A2 of drawing 4).

[0024] If a video data is inputted, by the dynamic-image display-control program 31, the packet ID is judged (step A3 of drawing 4), and when it is except an S.P pack, it will be transmitted to (N of step A3 of drawing 4), and the DVD decoder board 17 (step A8 of drawing 4). On the other hand, when it is an S.P pack, choice of the text data stored in (Y of step A3 of drawing 4) and its S.P pack and the need existence of a translation are judged (step A4 of drawing 4, step A5), it is the text data which should be taken up, and only the required data of a translation are handed over and translated into the translation application program 32 (Y of step A4 of drawing 4, Y of step A5, step A6).

[0025] Thus, as for the text data of the obtained language wishing a user, subimage data are created by dynamic-image display-control program 31 self (step A7 of drawing 4), and this created subimage data is transmitted to the DVD decoder board 17 (step A8 of drawing 4). The above processing is repeated till termination.

[0026] On the other hand with the DVD decoder board 17, the synchronours control of various data is performed by the system decoder section 172. When the transfer data from the dynamic-image display-control program 31 are received (step B1 of drawing 5), by this system decoder section 172 the case where it was judged whether it is subimage data (step B-2 of drawing 5), and this transfer data is not subimage data -- (N of step B-2 of drawing 5) -- Packet ID is judged further (step B3 of drawing 5). And when this packet ID is an Audio packet, it will be transmitted to ("Audio" of step B3 of drawing 5), and the voice decoder section 173 (step B4 of drawing 5), and the voice output of the decoding will be given and carried out (step B5 of drawing 5). On the other hand, when this packet ID is a Video packet, after being transmitted to ("Video" of step B3 of drawing 5), and the MPEG 2 decoder section 174 (step B6 of drawing 5) and giving decoding, it is transmitted to the synthetic section 175 (step B7 of drawing 5 R> 5).

[0027] moreover -- the case where transfer data are subimage data -- (Y of step B-2 of drawing 5) -- it is transmitted to the synthetic section 175 as it is (step B7 of drawing 5). And the video output of the composition with the main image and a subimage will be performed and carried out in this synthetic section 175 (step B8 of drawing 5).

[0028] Thus, with the personal computer of this operation gestalt, the subgraphic display of two or more language can be supported only by having the text data for one nation, for example. Moreover, by recording subimage data as text data, this text data is compounded with the main image as a subimage, and does not carry out a cine mode display, but

it becomes possible to perform easily making it display on the cheap display in which a text display is possible separately etc.

[0029]

[Effect of the Invention] According to the dynamic-image display system and the animation data-logging approach of this invention, as explained in full detail above, it can support now by one text data, and that work cost can be reduced sharply and the subgraphic display by which language also becomes possible [preventing consuming the limited resource in a record medium vainly].

[0030] Moreover, by recording subimage data as text data, compound this text data with the main image as a subimage, and it does not carry out a cine mode display. While being able to provide as it is, without spoiling a part of main image by the title to the user who it can also make it easy to display on the cheap display in which a text display is possible separately, for example, does not need a title To the user who needs a title, a title can be offered through the display.

MEANS

[Means for Solving the Problem] In order to attain the purpose mentioned above, it is made to make this invention record on a storage by making subimage data, such as a title, into text data as an image data. And a subimage is created from this text data, and it compounds with the main image, and is made to carry out a cine mode display. Moreover, when the language for which a user asks differs from the language of the text data recorded as subimage data, it translates into the language with which a user asks for the text data, and a subimage is created from the text data after the translation.

[0008] Therefore, in this invention, the subgraphic display by which language can also be supported now by one text data. the work cost can be boiled sharply, and it can reduce, and the limited resource in a record medium is consumed vainly -- ** (the subimage data of other language other than the language which he uses for a user are useless) -- it becomes possible to prevent what was said.

[0009] The text data made to record as this subimage data By recording the text data created in two or more language (here, Japanese shall be adopted as language other than English) including the language (here, it considers as English) which the number of does not necessarily need to be one, for example, was defined beforehand It makes it possible to display a subimage without a translation about the language (it to be supposed for that there are many users of English and Japanese here) considered for there to be many users. Also about the subgraphic display in other language By translating from the language (English) defined beforehand, it does not place out of a support.

[0010] Moreover, by recording subimage data as text data, this text data will be compounded with the main image as a subimage, and will not carry out a cine mode display, but it can also be made easy to display on the cheap display in which a text display is possible separately. It can provide as it is, without spoiling a part of main image by the title to the user who follows, for example, does not need a title, a title can be offered through the display to the user who is one side and needs a title, and it becomes possible to respond to coincidence at the needs of both users.

[0011] Furthermore, it has disk drive equipment which drives record media, such as DVD, and it is also possible to utilize the translation software which is a user's property in the computer system corresponding to multimedia in which a cine mode display, voice playback, etc. are possible.

[0012]

[Embodiment of the Invention] Hereafter, 1 operation gestalt of this invention is explained with reference to a drawing. The system configuration of the personal computer concerning this operation gestalt is shown in drawing 1 . This personal computer is equipped with PCI bus 1, CPU11, the host/PCI bridge 12, main memory 13, HDD14, the keyboard controller (KBC) 15, the DVD drive 16, the DVD decoder board 17, the display controller 18, video memory (VRAM) 19, CRT20, etc. as shown in drawing 1 .

[0013] CPU11 controls actuation of this whole system, and performs an application program including the operating system and utility which were stored in main memory 13. And the dynamic-image display control of the video data read by the DVD drive 16 is performed by the dynamic-image display-control program 31 performed by this CPU11.

[0014] The DVD drive 16 drives DVD which carried out digital compression coding and recorded the video data with a subimage, and functions as drive equipment for reading the video data recorded on the DVD. And since the record approach of the subimage data to DVD driven by this DVD drive 16 is just going to set to one of the descriptions of this invention, with reference to drawing 2 , that record format is explained first.

[0015] Video datas, such as a movie, consist of the management information section and data division, and data division contain many data blocks as shown in drawing 2 . The linguistic code of text data used as a subimage mentioned later is stored in this management information section by that class. Moreover, the Navi pack is arranged at the head of each data block, from this Navi pack to the following Navi pack becomes one data block, and the record location of each of each Navi pack is also stored in the management information section.

[0016] On the other hand, the Video pack, the S.P pack, and the Audio pack are multiplexed and recorded on each data block. And in a Video pack, voice data is stored in subimage data and an Audio pack at the main image data and an S.P pack, respectively. And the storing approach of the subimage data to the S.P pack of these is just going to consider as the description of this invention. This S.P pack consists of a header and an S.P packet, and the title data of at least one or more languages are intermingled in this S.P packet, and it is stored in it. And this title data consists of control information and text data, and the linguistic code of this text data, a time stump, playback time amount, etc. are stored in control information. That is, in this invention, it is characterized by the point which does not record subimage data, such as a title, on a record medium by the image data, but is recorded on a record medium by text data.

[0017] After the video data recorded on DVD in such a format is read by the DVD drive 16, by the dynamic-image display-control program 31 in which execution control is carried out by CPU11, it separates into a Video pack, an S.P pack, and an Audio pack, and the Video pack and Audio pack of these are transmitted to the DVD decoder board 17.

[0018] With the DVD decoder board 17 which received this transfer by the PCI bus interface section 171, a Video pack is handed over by the MPEG 2 decoder section 174 under the synchronours control of the system decoder section 172, an Audio pack is handed over by the voice decoder section 173, respectively, and decoding is given. On the other hand, an S.P pack will be used for creation of a subimage by the dynamic-image display-control program 31 as it is. Creation of this subimage is first started from choice of the text data stored in an S.P pack. When the linguistic code which shows the language with which a user wishes this choice is stored in the management information section, only the text data by which that linguistic code was stored in control information is taken up, and all the other text data are canceled. When the linguistic code which shows the language which a user wishes on the other hand is not stored in the management information section, only the text data by which the linguistic code defined beforehand was stored in control information is taken up, and all the other text data are canceled.

[0019] The case where the linguistic code which shows the language which a user wishes here is stored in the management-information section means that the text data created in the language which a user wishes exists, and the case where the linguistic code which shows the language which a user wishes on the other hand is not stored in the management-information section means that the text data created in the language which a user wishes does not exist. Then, it requests changing the dynamic-image display-control program 31 into the text data of the language with which he hands over to the translation application program 32 with the linguistic code which shows the language with which a user wishes the taken-up text data (language defined beforehand), and a user wishes the text data, when the linguistic code which shows the language which a user wishes is not stored in the management information section. This translation application program 32 may apply the translation software which is the application program which is stored in main memory 13 and performed by CPU11, for example, is a user's property. Therefore, the dynamic-image display-control program 31 will not be concerned with whether DVD is recording the text data of which language as subimage data, but the text data of the language which a user wishes can be obtained.

[0020] Next, the dynamic-image display-control program 31 creates a subimage from the text data of the language which the user who did in this way and got wishes, and transmits this created subimage to the DVD decoder board 17. The synchronization with the main image is taken and this subimage is handed over by the system decoder section 172 at the synthetic section 175. And in the synthetic section 175, composition with the main image created by decoding of the MPEG 2 decoder section 174 and the subimage created by the dynamic-image display-control program 31 is performed, and one dynamic image is created. And the dynamic image which the dynamic image with which this main image and a subimage were compounded was supplied to the digital video interface section 176 and the NTSC encoder 177 from the synthetic section 175, and was supplied to the digital video interface section 176 is displayed on CRT20 by being further transmitted to the display controller 18 and being written in video memory (VRAM) 19. On the other hand, the dynamic image supplied to the NTSC encoder 177 is enabling the display on a television screen, when encoded by the NTSC signal.

[0021] namely, in the personal computer of this operation gestalt As shown in drawing 3 , the video data recorded on DVD read by the DVD drive 16 After being transmitted to the dynamic-image display-control program 31 performed by CPU11 (drawing 3 (1)), The main image data are transmitted and decoded by the DVD decoder board 17 (drawing 3 (2)), and a subimage will be created by dynamic-image display-control program 31 self after subimage data are handed over by the translation application program 32 if needed (drawing 3 (3)).

[0022] And it enables a display on a television screen by performing the output of an NTSC signal while it is displayed on CRT20 by being transmitted to the display controller 18 and written in video memory (VRAM) 19 (drawing 3 (5)), after the subimage created by this dynamic-image display-control program 31 is transmitted to the DVD decoder board 17 (drawing 3 (4)) (drawing 3 (5) '). In addition, also when it replaces with a transfer of the subimage from the dynamic-image display-control program 31 to the DVD decoder board 17 and dynamic-image display-control program

31 itself draws a subimage to video memory (VRAM) 19 (drawing 3 (4)), it is possible to display on CRT20 the dynamic image with which the main image and the subimage were compounded (subgraphic display in a television screen is not performed in this case).

[0023] Here, with reference to drawing 4 and drawing 5 , the operations sequence of the personal computer system of this operation gestalt is explained. In the personal computer system of this operation gestalt, after the assignment input of the language of a subimage is performed by the user (step A1 of drawing 4) and the assignment input of the language of this subimage is first performed at the time of playback of a dynamic image, the input of a video data is started (step A2 of drawing 4).

[0024] If a video data is inputted, by the dynamic-image display-control program 31, the packet ID is judged (step A3 of drawing 4), and when it is except an S.P pack, it will be transmitted to (N of step A3 of drawing 4), and the DVD decoder board 17 (step A8 of drawing 4). On the other hand, when it is an S.P pack, choice of the text data stored in (Y of step A3 of drawing 4) and its S.P pack and the need existence of a translation are judged (step A4 of drawing 4 , step A5), it is the text data which should be taken up, and only the required data of a translation are handed over and translated into the translation application program 32 (Y of step A4 of drawing 4 , Y of step A5, step A6).

[0025] Thus, as for the text data of the obtained language wishing a user, subimage data are created by dynamic-image display-control program 31 self (step A7 of drawing 4), and this created subimage data is transmitted to the DVD decoder board 17 (step A8 of drawing 4). The above processing is repeated till termination.

[0026] On the other hand with the DVD decoder board 17, the synchronours control of various data is performed by the system decoder section 172. When the transfer data from the dynamic-image display-control program 31 are received (step B1 of drawing 5), by this system decoder section 172 the case where it was judged whether it is subimage data (step B-2 of drawing 5), and this transfer data is not subimage data -- (N of step B-2 of drawing 5) -- Packet ID is judged further (step B3 of drawing 5). And when this packet ID is an Audio packet, it will be transmitted to ("Audio" of step B3 of drawing 5), and the voice decoder section 173 (step B4 of drawing 5), and the voice output of the decoding will be given and carried out (step B5 of drawing 5). On the other hand, when this packet ID is a Video packet, after being transmitted to ("Video" of step B3 of drawing 5), and the MPEG 2 decoder section 174 (step B6 of drawing 5) and giving decoding, it is transmitted to the synthetic section 175 (step B7 of drawing 5 R> 5).

[0027] moreover -- the case where transfer data are subimage data -- (Y of step B-2 of drawing 5) -- it is transmitted to the synthetic section 175 as it is (step B7 of drawing 5). And the video output of the composition with the main image and a subimage will be performed and carried out in this synthetic section 175 (step B8 of drawing 5).

[0028] Thus, with the personal computer of this operation gestalt, the subgraphic display of two or more language can be supported only by having the text data for one nation, for example. Moreover, by recording subimage data as text data, this text data is compounded with the main image as a subimage, and does not carry out a cine mode display, but it becomes possible to perform easily making it display on the cheap display in which a text display is possible separately etc.
